

How to Commit Changes to Git

This document outlines the basic steps to **stage, commit, and push** changes to a Git repository from the command line or PowerShell.

1. Stage Your Changes

Add specific files:

```
git add filename.ext
```

Add multiple files:

```
git add file1.ext file2.ext
```

Add all changes in the current directory:

```
git add .
```

Tip: Always check what you are about to commit with:

```
git status
```

2. Commit Your Changes

Write a short, descriptive commit message:

```
git commit -m "Describe the changes you made"
```

Example:

```
git commit -m "Updated README with new setup instructions"
```

Tip: Commit messages should be clear and in the present tense (e.g., "Add feature X" instead of "Added feature X").

3. Push Changes to Remote Repository

Push to the default branch (often `main` or `master`):

```
git push
```

Push to a specific branch:

```
git push origin branch-name
```

Tip: Always pull the latest changes before pushing:

```
git pull
```

4. View Commit History

To see a list of past commits:

```
git log
```

Press `q` to quit the log view.

To view a one-line summary:

```
git log --oneline
```

5. Using PowerShell

The commands are the same in PowerShell, but you can also use:

- **Check Git version:**

```
git --version
```

- **Run commands in sequence:**

```
git add .; git commit -m "Your message"; git push
```

Tip: Use `;` to chain commands in PowerShell.
