

Markdown Joke of the Day

Q: Why did the `Markdown` file apply for a job at GitHub?

Because it had all the *right formatting* and knew how to make a great **README**!

Explanation

- **Markdown** is a lightweight markup language.
- `.md` is the standard file extension for Markdown files.
- GitHub uses `.md` files extensively for documentation like `README.md`.
- The joke plays on the idea that a Markdown file is "job-ready" just by being properly formatted.

Who Invented Markdown?

Markdown was created in **2004** by **John Gruber**, with significant contributions from **Aaron Swartz**. Their goal was to make writing on the web as easy-to-read and easy-to-write as possible.

Fun Fact

The `.md` extension wasn't formally invented by Markdown's creators, but it became the community standard thanks to platforms like GitHub that made it default.

"Markdown: easy to write, easier to read, and now... employed!" 

Examples of `.md` Files

Here are some common types of Markdown files you might encounter:

- `README.md` – The front page of most GitHub repositories; explains what the project is and how to use it.
- `CONTRIBUTING.md` – Guidelines for contributing to a project.
- `CHANGELOG.md` – A record of changes, updates, and version history.
- `LICENSE.md` – License terms and legal info.
- `index.md` – Common in static site generators as the entry point for a page or section.

These files are plain text, but when rendered (like on GitHub), they become cleanly formatted web pages.
